It is used to create 2D CAD (Computer-Aided Design) drawings and 3D CAD (Computer-Aided Design) drawings in the auto-drafting or modeling mode. It comes with features to create 2D CAD drawings and 3D CAD drawings in a very simple manner. When a user starts to create a drawing using AutoCAD, the user will be guided through the process step-by-step by the software to build the drawing. The software will prompt the user to create points, lines, circles, arcs, arcs, polylines, polylines, texts and lines, while maintaining a consistent flow. Prerequisites: 1. A computer with an internal screen or a monitor. 2. CAD software installation CD or the DVD. 3. Printer, scanner, and digital camera for capturing photos. Features of AutoCAD: 1. Uses a wireframe model. 2. Drawings are made of "objects" and "viewports." 3. Can import and export to formats such as DXF, DWG, DWF, and IGES. 4. Creates drawings on the screen or in a file that can be viewed on a monitor or printer. 5. Can be used for 2D drafting or 2D/3D drafting. 6. Viewing Options: 1. View 3D models in wireframe 2. Installing the Deck Choose where to install the deck by first placing the kit in your garage or driveway. Cut an opening in your concrete block wall for the deck. If you have a walkout basement, make sure there is room to build a small wall on the inside of the slab and use this space to cut your opening. If you do not have a walkout basement, make sure you have enough space in your garage or driveway to lay the deck. Use a level to lay the deck on and cut a line across the width. Be sure the cutting line is perpendicular to the garage wall. Remove a section of garage wall, or place a temporary wall to protect your garage. This will prevent any damage to your garage. Remove the existing insulation from the space under the garage wall. This will expose the space between the concrete block wall and the floor of the garage. Using a pry bar, a hammer or a chisel, remove a few concrete block from around the edges of the concrete block wall. Put a good coat of deck sealer on the exposed area. This will prevent moisture from reaching the concrete block. Put a good coat of deck sealer on the rest of the concrete block wall. This will make it easier to install the deck and keep it clean. Place a thin layer of deck underlayment over the concrete block wall, inside the concrete block wall. This will protect the concrete block from moisture and the deck from dirt and water. Place the deck over the underlayment. The underlayment should be slightly higher than the deck and overlap at the edges by at least 4 inches
