This article introduces how to use AutoCAD on Linux. You can read more about AutoCAD on Wikipedia, the official AutoCAD website, and Autodesk website. The various commands in AutoCAD are divided into a number of different categories that you can toggle on and off in the Options window. These categories consist of commands that can be used for modeling, plotting, and other functions. AutoCAD has been available in a number of different interfaces in the past. The most common ones include: Operating system dependent app AutoCAD LT is a slimmed down version of AutoCAD that comes bundled with the Microsoft Windows operating system. You can download AutoCAD LT from the Autodesk website. This program is only available for Microsoft Windows operating systems. You can download AutoCAD LT from the Autodesk website. XREF The XML Reference Architecture for Enterprise data

enables XML, the Extensible Markup Language, to be used to define a data structure, or model, in a standard and complete way, as a source of reference for the users and for programs. A complete description of the architecture is available from the Autodesk Data & Systems Blog. XREF is derived from the XML reference architecture, which is the design foundation for the XREF Architecture. This architecture makes it possible to build XML-based, or Extensible, data driven applications and content management systems. ObjectARX is the base class library for the Autodesk XML Reference Architecture for Enterprise. "AppDomain" In the past, the appDomain was a concept used to describe a logical zone of control within which different programming languages could be run. If the appDomain concept is used within the scope of an application, it is possible to execute a number of programs concurrently within an Autodesk Application Object (a.k.a. AppDomain). In this way, it is possible to use multiple languages for the same program. Also, some languages are unable to work directly with the Autodesk Application Object API. A developer can use the application object model API to abstract the access to the API of specific languages, allowing the application object to be the target of other languages such as C++ and Java. Layer 0 Autodesk Application Objects can be found in the layer zero (0). It is possible to perform a number of tasks in this layer. CAD control There is a CAD

control class library (objectARX, Autocad.Xy) for the functionality of the product. The functionality of the objects may include: software rendering control memory management rendering controls CAD automation class library (AutocadApp, Autocad.Xy, AutoCAD.Xy) toolbars device drivers DIP (Direct Input Panel) coding animation script management Calculation The basic class library for calculations (Calculation.Xy) is also included.
