A glassy polymer, poly(pentaerythritol-co-ethylene)bis(oxalate) (PEBO), is prepared and evaluated for its ability to bind organic contaminants from water. TGA studies and FT-IR characterization revealed that PEBO is thermally stable and that the presence of the oxalate moiety promotes the formation of PEBO aggregates, which makes the removal of contaminants easier. PEBO successfully removed organic contaminants, including perfluorinated chemicals (PFCs), from aqueous solution under ambient conditions. The maximum sorption capacity for PFCs (C10-C18) at 25 degrees C was 6.0 g g(-1) and at 40 degrees C was 13.8 g g(-1). The sorption capacity decreased as the degree of hydrophobicity of the sorbate increased. Equilibrium analysis shows that PEBO removal of PFCs can be described as a pseudo-second-order process. Therefore, PEBO shows the potential to be used as a low-cost and efficient material for removal of organic contaminants from aqueous solution.In a bitter pill for Sprint and T-Mobile, the Department of Justice has said that its trial against AT&T Inc. will kick off on February 26, 2011.
