This invention relates to a method for displaying a schedule on a display screen of a display device for presenting a picture representing a schedule, and to a display device. In recent years, many electronic schedulers, and various portable devices for displaying a time table on a display screen and providing a user with services, have been developed and are in use. JP-A-7-53177 proposes an example of a display device of this type. A display device of this type comprises a display screen on which a time table is displayed, and a time information processor which displays on the display screen the time table which is indicated as the time of operation by a time master. When a user operates an input unit provided on the display device, the time master gives a command to the time information processor, and the time information processor determines a time of operation indicated by the input unit and indicates the determined time of operation on the display screen. The above-described conventional display device is equipped with a time information processor, and the time information processor thus has an extremely large number of circuit elements, such as a CPU, a ROM, a RAM, a timer, and a comparator. The display device thus requires a large space for installing the time information processor. Therefore, in order to reduce the space for installing the display device, a display device which can omit the time information processor has been proposed. As a display

device for omitting the time information processor, a display device using a touch panel has been known. When the user presses the touch panel, the display device detects the location of the pressed position and the pressing time, and determines a time of operation based on the time at the pressing position and the pressed time. However, the user can hardly determine the correct time of operation from the time represented by the time table displayed on the display screen. In other words, since the time represented by the time table is not calculated based on the time of operation which is indicated by the input unit, the user cannot determine a time of operation in a normal manner.The present invention relates to electrically insulated paint rollers and more particularly to an electrically insulated paint roller having a cylindrical shell which is shaped to conform to the user's hand and an electric motor housed in the shell to drive the paint roller. Prior to the present invention, many paint roller devices have been proposed, which use a resilient handle attached to a cylindrical shell which is provided with a cylindrical surface to support a quantity of wet paint

System Requirements For AutoCAD:

Windows XP SP2 or later Mac OS X 10.4.1 or later Linux (Ubuntu 9.04+) OSX Lion or later Canonical LiveCD (Ubuntu 11.04+) I've had the chance to finally check out the highly anticipated Ubuntu 11.10 (Oneiric Ocelot) and I am very impressed. For starters, it's a very fast system. I even noticed some pretty impressive speed improvements in the Settings program. Another huge highlight for me is the fact that Unity
