Cross-linked elastomeric sheathing compounds (British Standard). 1.2.2. Value to be obtained for the tensile strength: - median, min. N/mm². 5.0. 12.5. 10.0. 15.0. 1.2.2.1.1. "Specially formulated, cross-linked elastomeric compounds complying with BS EN 50363 have been developed for the insulation, sheathing and covering of low voltage energy cables. Through the use of a combination of chemical additives, these compounds have been subjected to an extended extrusion process in order to increase their mechanical properties as well as their resistance to degradation by (halogenated) flame retardants. In the event of a fire the use of these materials enables the fire to be confined in the cable body." 1.2.2.1.2. "The cross-linking of the elastomeric compounds is effected in a two-step process." 1.2.2.1.3. "The components of the cross-linking system, consisting of tin, malein polyol, ammonia, urea and nitric acid, are mixed together with the elastomeric compounds and this mixture is then extruded at high temperature and pressure. This extrusion process gives the compounds their cross-linked form and also results in their physical properties being improved." 1.2.2.1.4. "The ratio of reactive components in the cross-linking process is determined by a number of factors. The main factor is the type of elastomeric compound that is used, but the composition and nature of the reactive components also play a role. The main types of elastomeric compound that can be
