I have a project (Console Application) in Visual Studio 2008 that won't build on Windows 7 64 bit. When I build the solution I get the error message: "Failed to resolve '..' in 'C:\Program Files\Microsoft Visual Studio 9.0\Common7\IDE\ProjectAssemblies\HelloWorldProject\HelloWorldProject'." I've tried re-installing VS, deleting the C:\Program Files\Microsoft Visual Studio 9.0\Common7\IDE directory, updating .Net Framework and re-installing VS. How can I fix this error? A: Close VS. Delete the bin, obj and debug folders from the directory you get the error. Delete the bin and obj folders from the.suo file and re-open VS. Check again. This fixed it for me. Q: Fastest Java library for parsing XML I need to parse huge xml files (20-50 MB) to get some key information. The xml files are of the same format, and the only difference is the set of xml tags. The xml files are published once a week and it would be great to parse them once per day and then store the data. The parsing time is the critical path, so I can't spend a lot of time implementing a parser. It would be fine if I spent a few days of coding, but it will be unacceptable to spend weeks on this. My question is: What is the fastest library for Java for parsing xml (in particular I need to parse the given format)? I would prefer if it could parse the xml file inside java, but this is not essential. A: Have you tried the online xml parser

This subproject is one of many research subprojects utilizing the resources provided by a Center grant funded by NIH/NCRR. The subproject and investigator (PI) may have received primary funding from another NIH source, and thus could be represented in other CRISP entries. The institution listed is for the Center, which is not necessarily the institution for the investigator. Human T-cell leukemia virus type 1 (HTLV-1) infection is associated with multiple malignancies, including adult T-cell leukemia/lymphoma and HTLV-1-associated myelopathy/tropical spastic paraparesis. The mechanisms of virus-induced leukemogenesis are not yet fully understood, but infectious virions are thought to be essential for viral-cellular interactions that lead to transformation. Our preliminary data showed that HTLV-1-infected T-cell lines, which are widely used to study HTLV-1 pathogenesis and tax trans-activator functions, do not produce infectious virus, but when they are co-cultured with uninfected T-cell lines, the presence of the latter is required for virus production. This suggests that the cells may support virus production indirectly. Using an in-house HTLV-1 molecular clone system we have confirmed that the presence of uninfected cells is necessary and sufficient for virus production in vitro. Using RNA interference, we showed that the HTLV-1 trans-activator Tax2, but not Tax1, is required for virus production. To address the role of Tax2, we generated a Tax2 knockout (KO) mutant of HTLV-1 and infected human T-cells with the virus. This is the first reported, complete knockout mutant of HTLV-1. After infection, Tax2 KO virus is capable of producing viral proteins, but fails to produce mature viral particles in vitro. Since Tax2 is an obligatory factor for virus production, we reasoned that Tax2 may be necessary for virus

Link 2D and 3D models: Linking 2D and 3D models has been a powerful tool in creating and editing large projects, but it's also a challenge when working on a project with different teams. To

speed up this process, you can now link 2D and 3D models using the new Automate Link command. (video: 2:56 min.) In addition to the standard reference frame axes and project area, the project area now has 3D coordinates, making it even easier to create and edit models. (video: 2:58 min.) You can now also link different views of the same project area together with Project Reference Frames. (video: 2:48 min.) Export to web-based formats: Project web viewers that support web-based viewing, editing, and collaboration have been widely used in the past.
