Field of the Invention The present invention relates to a print mode determining apparatus and a print mode determining method for determining whether a print mode can be changed to a paper format specified by the user. 2. Description of the Related Art Recently, a print system has been proposed in which a user specifies, from a plurality of paper types (printing paper types) in a predetermined paper format, a desired paper format (print paper format) from among the plurality of paper types in which a print output is to be output to the outside. In this print system, for example, when the user specifies, from among the plurality of paper types in a certain paper format, only "standard paper", the print system determines that the print paper format can be changed to the paper format specified by the user. In this case, the user is notified of the fact that the print paper format can be changed to the paper format specified by the user. By contrast, when the user specifies, from among the plurality of paper types in a certain paper format, only "twin-sheet paper", the print system determines that the print paper format cannot be changed to the paper format specified by the user. In this case, the user is notified of the fact that the print paper format cannot be changed to the paper format specified by the user. In the print system in which the user specifies, from among the plurality of paper types in a predetermined paper format, only "standard paper" or only "twin-sheet paper", when the user specifies only the "standard paper", the user may erroneously specify the paper format that can be changed to the paper format specified by the user. In this case, a problem arises in that the user cannot obtain a desired print output.Q: How to call method that takes an iterator from a generic method in Java I have a method to initialize a thread pool, as follows: private static T createThreadPool(int corePoolSize, int maximumPoolSize,

The Markup Assist tool lets you assign a clickable annotation to a specific element in your drawing (like a wall). With it, you can conveniently place comments on any surface in your drawing. Markup Import lets you import native 3D-shape CAD data (such as SolidWorks or Inventor) into AutoCAD and ACIS. Shape Search: You can now quickly find an existing block, shape, or text on any drawing sheet without knowing its name, and click to open it. Text Input Improvements: You can now type words while simultaneously editing a specific layer. For example, while editing text on the floor layer, you can type "next to window." When you type text in a polyline or polygon, you can have the text follow the shape and be invisible until you choose to make it visible. Drawing Components: Bring your drawings to life with custom drawing components that can be edited in separate windows. Customize the appearance of any drawing component with different materials and colors to suit your personal style. When you open a Custom Drawing Components file in AutoCAD, a drop-down palette lets you preview and select a variety of built-in drawing components. In AutoCAD 2018, you could create one custom drawing component and apply it to many drawing elements. Now, you can have as many custom drawing components as you want, and apply them individually. ArcGIS Map Components: Explore maps with cool new features, such as pop-up panels, overlays, map tools, and more. Ease Map Creation: Create topographic maps and more easily generate landscape drawings. Map Matching: Add points, lines, or polygons to create new maps, and define parameters for importing a map. Advanced 3D Map Features: You can now automatically snap to a plane, surface, or edge and export your designs to a local file. 3D Objects: Discover how to create 3D models in the various ACIS file formats.
